

CUSHION PREFILL DRIVE BONNET SIDE

LIQUID CHAMBER SIDE

Options to VLP single connection - see LP series.

Recommended tightening torque values, by bolt diameter and bolt grade .
 Using anti-seize, these figures produce a preload approx. 70% of min. yield

DOUBLE LAYER DIAPHRAGM AND SECONDARY CONTAINMENT SEALING

COST REDUCTION & LIFE INCREASE - SPARES

by the use of diaphragm design above, please see FL/HP "X" shown marked in the prefill drive bonnet is a counterbore into which the dome of Pt Nbr. 8D will enter. With this modification to pre 1997 units, it is possible to change to the MTFE alternate sub-assembly from the virgin PTFE, that was specified by pump vendors. The flex life, impermeability, and stroke length ability of the DW---MTFE diaphragms is a multiple of the Virgin PTFE diaphragm.

The cost of spare DW---MTFE is half that cost of DF--- elastomer backed virgin PTFE diaphragms

ADDITION OF SECONDARY CONTAINMENT SEALING AND optional Z-CLASS DIAPHRAGM LAYER

This is not an universally available upgrade, and only offered for units returned to the factory for re-certification and service.

The company will service any of its product FOR THE SAME PRICE AS THE SPARES KIT
